

Press Release: June 29, 2010

Manhattan Resources exhibited at the 101<sup>st</sup> Annual Conference and Trade Show of the International District Energy Association (IDEA) in Indianapolis June 13-16, 2010. The conference brought together over 460 professionals within the district energy field with Manhattan Resources being the only Executive Search firm in attendance.

District energy systems produce steam, hot and/or chilled water at a central plant. The steam or water is then transferred through piping systems to provide hot water heating and air conditioning to buildings. The result is that buildings serviced by district energy systems do not require their own boilers, furnaces, chillers or air conditioning providing valuable benefits such as cost efficiency, flexibility, reliability, and convenience to customers.

Specials thanks to Steve Swinson, President of Thermal Energy Corporation and Board Member and former President of IDEA for the invitation to this year's meeting.
